**RE: International Paper Wiggins, MS Treated Wood Products Plant  
Hazardous Waste Management Permit No. HW-980-600-084**

Dear Mr. Shanks and Mr. Williams:

In September 2006, International Paper completed the removal of contaminated soil from the Treated Wood Products Plant in Wiggins, MS. The Mississippi Department of Environmental Quality (MDEQ) was notified of the existence of this contaminated soil in a letter dated August 25, 2006. MDEQ was consulted by telephone and email during the soil removal process to ensure that the removal would meet with MDEQ approval. A report containing the supporting documentation of the soil removal is enclosed for your review.

A groundwater monitoring well was installed in the area of the soil pile as requested by MDEQ in a letter dated August 31, 2006. This new well is scheduled to be sampled the week of November 13, 2006. The analytical results will be provided separately to MDEQ following validation.

Please contact me with any questions or comments.

Sincerely,

A handwritten signature in blue ink that reads "Thomas C. Richardson".

Tom Richardson

## EXECUTIVE SUMMARY

This report provides documentation of the excavation and removal of a waste soil pile at the International Paper Wood Treating Facility in Wiggins, MS. The removal action was performed from August 28 to September 26, 2006. 1,160 tons of hazardous waste soil were removed and incinerated at the permitted TSDF Veolia facility in Port Arthur, Texas. IP and the disposal facility characterized the waste soil as listed waste F032 and toxicity characteristic waste D037. Excavation work was conducted by SFC Contract Services and waste hauling services were provided by Triad Transport and CEI. Approximately 500 cubic yards of common fill was brought on-site from an off-site source to fill the excavation to surrounding grade.

The waste soil pile was approximately 8 feet high, 20 feet wide and 150 feet long and was located in the pole accumulation area in the central area of the property. The waste soil pile was excavated to a native soil layer at a below grade depth ranging from 2 to 4 feet. Twelve (12) confirmatory soil samples were collected of the underlying clayey soil at an approximately 50-foot spacing. There were four bottom samples, six samples along the sidewalls, and one sample on each end wall. Final confirmatory soil sample analytical results were below the Mississippi Department of Environmental Quality (MDEQ) Brownfields Tier 1 Target Remedial Goals (TRGs) for unrestricted soil for pentachlorophenol (PCP) and polycyclic aromatic hydrocarbons (PAHs). Following receipt of confirmatory soil sample analytical results the excavation was backfilled.

As requested by the MDEQ, a shallow groundwater monitoring well will be installed in the area immediately down gradient of the former soil pile location to assess the potential for a release of PCP and/or creosote from soil to groundwater. The well installation will be documented and reported separately along with additional groundwater remediation investigations being conducted at the facility.

---

## **1.0 INTRODUCTION**

This is the Soil Removal Completion Report for the recently discovered waste soil pile at the International Paper Treated Wood Facility in Wiggins, Mississippi. This report includes the details of the removal activities, the analytical results of confirmation samples collected from the underlying soil following excavation, and the final disposition of the removed waste soil.

### **1.1 SITE SETTING**

The Wiggins facility is located in Stone County, Mississippi, approximately 2 miles south of the town of Wiggins, just east of U.S. Highway 49, in Section 31, Township 25 South, Range 11 West, at latitude  $30^{\circ} 51' 59''$  and longitude  $89^{\circ} 10' 54''$  (Figure 1). The Wiggins facility, which is located on 125 acres of land, has been operating at this location since December 1969. The Wiggins facility operations currently take place on approximately 85 acres of the site (Figure 2).

### **1.2 SITE OPERATIONS**

Operations currently conducted at the Wiggins facility involve treating utility poles, pilings, and structural timbers with pentachlorophenol (PCP) and chromated copper arsenate (CCA). Wood-treating operations are conducted in two parallel treatment areas located in the northwestern portion of the Wiggins facility. Historical wood-treating operations also used creosote. Vehicle/equipment maintenance activities, pole-peeling, kiln-drying, and pole-framing activities are conducted in the southern portion of the Wiggins facility (Figure 2). The waste soil pile was located in the central area of the property.

---

## 2.0 SOIL REMEDIAL WORK PLAN

Upon discovery of the waste soil pile at the Wiggins facility, International Paper plant and environmental personnel made arrangements to have the soil characterized and procure contractors to remove and transport the soil to a disposal facility.

### 2.1 SOIL CHARACTERIZATION AND REGULATORY NOTIFICATION

As required under the facility's State of Mississippi Hazardous Waste Management Permit ID No. 980600084 Section I.E.14.c., the following is a summary of events that describes the discovery of the waste soil pile on the plant site which was provided in writing to MDEQ on August 25, 2006. A copy of the letter was also provided to the U.S. Environmental Protection Agency Region 4 (EPA).

July 5 2006: The soil pile was discovered during the facility divestiture due diligence process. The soil pile was located in the pole accumulation area in the central area of the property (See Figure 2). The pile measured approximately 8 feet high by 150 feet long by 20 feet wide and was partially overgrown with vegetation. The origin of the soil is uncertain but it is believed that equipment wash bay sump sediment and yard soil scrapings from small hydraulic leaks on trucks had been placed there in the past. The current practice is to drum this waste and ship it off site for proper disposal. Upon discovery, the International Paper Plant Manager arranged to have a random composite sample of the waste soil pile collected for analysis. The sample was collected on July 11, 2006.

July 20, 2006: The composite waste soil sample results were received and analyzed by EDL Labs, Inc. (See Appendix A). The sample tested positive for the wood treatment chemical pentachlorophenol (PCP) and several polycyclic aromatic hydrocarbons (PAHs). The waste soil sample was below the TCLP levels for metals. Based on these results, plans were begun to have the soil pile removed and properly disposed at an off site incinerator.

August 10, 2006: The International Paper Wood Products Division EHS Manager, Jim Thornton, was notified and direction was requested for handling the soil pile. Guidance was also requested for the assessment of the origin of the waste soil and appropriate corrective action.

August 16, 2006: International Paper Wood Products Division, Corporate EHS Services, and Legal personnel determined that the permitting agencies, MDEQ and EPA, should be contacted.

August 17, 2006: International Paper Wood Products Division EHS Manager, Jim Thornton, contacted Russ McLean of EPA Region 4 to report the discovery. Mr. McLean did not answer. Two messages were left on Mr. McLean's voice mail stating that the soil pile had been discovered and International Paper had characterized the waste soil and were making plans to ship it off-site for

SOIL REMOVAL COMPLETION REPORT  
WASTE SOIL PILE, IP TREATED WOOD FACILITY, WIGGINS, MS

---

disposal. Confirmatory samples of underlying soil would be taken to ensure complete removal. It was also stated in these messages that International Paper would report on the progress and completion of the removal. Mr. Thornton also called Brad Shanks of MDEQ who was given the same report. Mr. Shanks was told that the soil pile had been discovered as part of International Paper's due diligence for the facility divestiture process and that International Paper planned to characterize and move the soil off-site for disposal. Confirmatory samples would be taken to ensure complete removal. Mr. Thornton indicated that International Paper would keep MDEQ posted on progress and completion.

August 25, 2006: A letter was sent to MDEQ and EPA which included the above timeline of events and also the following statements:

- Given the ongoing groundwater monitoring there appears to be no potential to impact human health outside the facility via groundwater.
- The facility has not experienced elevated levels of pentachlorophenol nor PAHs in stormwater sampling which indicates the material has not left the site nor endangered human health off site via surface water runoff.
- The estimated quantity of soil in the discovered waste soil pile was approximately 150 tons, to be verified during removal and disposal.
- The corrective action plan is to remove the soil for off-site disposal by incineration. Veolia Environmental Services (formally Onyx Waste Company) was contracted to accept the material and incinerate it at their Port Arthur, TX facility.

Subsequent to IP's telephone calls and the August 25, 2006 letter, Mr. Brad Shanks of MDEQ visited the site to observe the waste soil pile and issued a letter to IP dated August 31, 2006. This letter communicated MDEQ's position that groundwater monitoring in the vicinity of the waste soil pile would be required. In addition, the MDEQ letter requested submittal of report of groundwater investigation results within 120 days of the date of the letter.

## 2.2 SOIL REMEDIAL CONTRACT SERVICES

Once the waste profile (**See Appendix B**) was accepted by Veolia, International Paper made arrangements to have the waste soil pile sent to the Veolia facility in Port Arthur, TX for incineration. For the excavation and transport of the waste soil, International Paper initially contracted with Triad Transport, Inc. of Houston, TX. IP switched to another contractor, SFC Contract Services (SFC) of Natchitoches, LA who completed the excavation and soil transport. IP also contracted with Premier

SOIL REMOVAL COMPLETION REPORT  
WASTE SOIL PILE, IP TREATED WOOD FACILITY, WIGGINS, MS

---

Environmental Services of Marietta, Georgia to perform the confirmation sampling on the underlying soil. Columbia Analytical Services provided the quick turnaround confirmatory soil sample analyses. Once the waste soil pile was removed and confirmation samples of the underlying soil were determined to be in compliance with the MDEQ Unrestricted Soil TRGs, local plant personnel used onsite equipment to place common backfill material from an off-site source into the excavation.

### 3.0 COMPLETED REMEDIAL ACTIVITIES

The remedial activities were conducted from August 28, 2006 to September 26, 2006 and involved the excavation, loading and transport of the waste soil pile from the International Paper Wiggins, MS facility to the Veolia Port Arthur, TX incineration facility.

#### 3.1 SOIL REMOVAL ACTIVITIES

The soil removal activities started on August 28, 2006 as Triad Transport began removal of the aboveground soil pile. Triad removed 8 truckloads of soil (approximately 180 tons) from August 28<sup>th</sup> until September 7<sup>th</sup>. The removal and transport of this soil were completed without any problems. However, IP recognized that the amount of material was going to be significantly higher than estimated and that Triad Transport was limited by the number of available transport vehicles. To expedite the remedial activities, IP contracted with SFC to excavate and transport the remainder of the waste soil pile. SFC had existing transportation agreements with CEI Transport and was able to secure 9 dedicated 25-ton dump trailers for this project, which was the daily capacity that Veolia would accept from this site.

SFC resumed the soil removal activities on September 18, 2006 and the remainder of the soil pile was excavated and transported by September 26, 2006. The soil pile was in an accessible area, thus the SFC operator was able to load the waste soil pile directly into the dump trailers using a common track hoe excavator. International Paper personnel weighed the trucks at the Wiggins scale house to make sure the loads were within the truck capacity. The transport trucks were properly placarded and manifested prior to leaving the Wiggins facility. Table 1 lists the waste manifest numbers and soil quantities for each truck loaded for this soil removal activity. **Appendix C** contains copies of the truck manifests along with the Certification of Destruction for each manifest of waste soil from this site.

As the above ground waste soil pile was removed, the operator would excavate below grade for complete removal of the waste soil. As shown in the enclosed photographs (See **Appendix F**), the underlying native soil is a hard, red clayey material, which was easily distinguishable from the waste soil material. Figure 3 shows the limits of excavation for the soil pile. The excavation work started on the northeast end of the soil pile and proceeded to the southwest. Initially the waste soil excavation was

SOIL REMOVAL COMPLETION REPORT  
WASTE SOIL PILE, IP TREATED WOOD FACILITY, WIGGINS, MS

---

about 20 feet wide and went down to a depth of approximately 3.5 feet below grade. As the soil pile was removed and the excavation proceeded to the southwest, the width and depth of the excavation reduced to approximately 14 feet wide and 2 feet deep on the southwest end of the waste soil pile. The final total length of the waste soil pile was approximately 136 feet.

After the waste soil excavation work was completed on Monday, September 18, 2006 and the first set of confirmation samples (1-3W, 4F) were collected, there was a rain event at the Wiggins facility. Since the analytical results from the underlying soil samples were not yet available, it was decided that the approximately 15,000 gallons of storm water runoff in the excavation would be containerized and processed through the Wiggins facility's on-site wastewater pretreatment system. The storm water runoff collected from the excavation was cycled through 3 batches of carbon filtrations prior to discharge to the City of Wiggins POTW. The analytical results indicated the water was non-detect for PCP, which is the main constituent of concern for the waste soil pile. **Appendix D** contains the treated water analytical reports from the batch operations that included the excavation storm water.

On the afternoon of Thursday September 21<sup>st</sup>, the last 20 feet of soil waste was excavated and stockpiled adjacent to the excavation. This was done to estimate the remaining waste soil volume and to collect the last set of underlying soil confirmation samples. The excavated waste soil was placed on a plastic liner, properly bermed and was covered with plastic at the end of the day's loading activities.

On Monday September 25<sup>th</sup>, SFC over-excavated at soil sample location 9F due to a confirmation sample exceedance (See Section 3.2). Approximately 14 tons of additional soil was removed to a depth of 4 feet in the area around 9F. SFC loaded this material onto a transport vehicle on Tuesday September 26<sup>th</sup> which completed the soil removal activities. All the plastic liner and cover material was properly disposed and the excavator was decontaminated prior to leaving the site.

### 3.2 CONFIRMATION SAMPLING AND ANALYTICAL RESULTS

As the waste soil excavation proceeded across the pile, Premier Environmental Service's personnel collected soil samples of the underlying soil. Each sample was collected in laboratory-supplied sample bottle using dedicated, disposable gloves. Each sample was properly labeled and placed on ice in a chest cooler following collection. The samples were shipped overnight via Federal Express to the Columbia Analytical Services (CAS) facility in Jacksonville, Florida using standard chain-of-custody protocol. All samples were received by CAS in good condition.

Based on the profile of the soil waste, the compounds of concern for the underlying soil were PCP and PAHs; thus the analytical method chosen for the confirmation samples was EPA Method 8270C for

SOIL REMOVAL COMPLETION REPORT  
WASTE SOIL PILE, IP TREATED WOOD FACILITY, WIGGINS, MS

---

semi-volatile organic compounds. In discussions with MDEQ, the most desirable compliance goal for the underlying soil was agreed to be the Brownfields Tier 1 Unrestricted Soil Target Remedial Goals (TRGs) for PCP and PAHs.

Given the depth and dimensions of this waste soil pile, the excavation was divided into 50 foot sampling zones (See Figure 3) with underlying soil samples taken from the excavation floor (#F) and walls (#W). The underlying soil samples were taken 50 feet apart and approximately in the middle of the excavated area.

Table 2 summarizes the analytical results for PCP and PAHs that were detected in the underlying soil confirmatory samples. In all, twelve (12) confirmatory samples were collected from the excavation; four (4) bottom samples, six (6) sidewall samples, and two (2) end wall samples. The laboratory data reports are provided in **Appendix E**.

The confirmatory sample analytical results were compared to the MDEQ Tier 1 Unrestricted Soil TRGs for PCP and PAHs (See Table 2). For Soil Samples 1-8 along with 10 & 11, the underlying soil met the MDEQ Tier 1 Unrestricted Soil TRGs. Soil Sample 9F from the excavation floor had a concentration of 3,330 ug/Kg for PCP which was above the MDEQ Unrestricted Soil TRG of 2,660 ug/Kg. Upon review of this result, the decision was made to over-excavate additional soil from this location (9F) and take a second confirmatory soil sample 12F at a lower depth. This second confirmatory sample met the MDEQ Tier 1 Unrestricted Soil TRG for PCP, which gave compliant results in every area of the excavation.

### **3.3 BACKFILL OF WASTE SOIL PILE EXCAVATION**

The Waste Soil Pile excavation was backfilled with approximately 500 cubic yards of a common backfill material from an off-site source and the backfill was compacted and graded to match the surrounding landscape. The backfill was purchased from Bond Lumber Company of Wiggins, MS. Backfill material was not placed into excavated areas until Premier personnel had verified that the confirmatory sample analytical results in that area were below the MDEQ Unrestricted Soil TRGs.

### **4.0 CONCLUSIONS**

This report documents the excavation and removal of a waste soil pile formerly located in the pole accumulation area of the International Paper Wood Treating Facility in Wiggins, MS. The removal action was performed from August 28 to September 26, 2006. 1,160 tons of waste soil were removed and disposed by incineration at the Veolia facility in Port Arthur, Texas as hazardous waste. Excavation work was principally conducted by SFC Contract Services and waste hauling services were provided by CEI Transport. The final confirmatory samples of the underlying soil

SOIL REMOVAL COMPLETION REPORT  
WASTE SOIL PILE, IP TREATED WOOD FACILITY, WIGGINS, MS

---

were below the MDEQ Tier 1 Unrestricted Soil TRGs. Approximately 500 cubic yards of common backfill were brought on-site from an off-site source to fill the excavation.

As requested by the MDEQ, a shallow groundwater monitoring well will be installed in the area immediately downgradient of the former soil pile location to assess the potential for a release of PCP and/or creosote from soil to groundwater. The well installation will be documented and reported separately along with additional groundwater remediation investigations being conducted at the facility.

Benzo(b)fluoranthene	875						11							
Benzo(k)fluoranthene	8,750						7.7							
Benzo(a)pyrene	87.5						3.5							
Indeno (1,2,3-cd)pyrene	875					2.8	2.4							
Dibenz(a,h) anthracene	87.5						1.7							
Benzo(g,h,i)perylene	2,350,000						3.1	2.1						

**Notes:**

- (1) The analytes listed were the only ones detected in the soil samples; other PAHs were non-detect for all samples
- (2) 1-Methylnaphthalene is not listed in the MDEQ TRGs. In a similar Soil Clean-up Target Levels table for the Florida DEQ, 1-Methylnaphthalene had a value of 200,000 ug/Kg
- (3) A blank value in the soil sample column indicates non-detect for that analyte
- (4) **Bold number** indicates exceedance of Tier 1 Unrestricted Soil TRG
- (5) #W indicates an Excavation Wall sample; #F indicates an Excavation Floor sample
- (6) Refer to Figure 3 for location of soil samples
- (7) Full analytical reports for the soil samples are in Appendix E

**Appendix A**

## GENERATOR'S CERTIFICATION

I hereby certify that all information submitted in this and all attached documents contains true and accurate descriptions of this waste. Any sample submitted is representative as defined in 40 CFR 261 - Appendix I or by using an equivalent method. All relevant information regarding known or suspected hazards in the possession of the generator has been disclosed. I authorize Onyx Environmental to obtain a sample from any waste shipment for purposes of recertification.

CERTIFICATE OF DESTRUCTION

Veolia ES Technical Solutions, L.L.C. has received waste material from INTERNATIONAL PAPER CO on 9/25/2006 as described on [State Manifest or Uniform] Hazardous Waste Manifest number 0000842VES.

Sequence 1

Profile Number: 261629  
Veolia Tracking ID: 595003

<u>Veolia Unit ID</u>	<u>Treatment Date</u>	<u>Date CD Was Issued</u>
1	9/28/2006	9/29/2006

I certify, on behalf of the above listed treatment facility, that to the best of my knowledge, the above-described waste was managed in compliance with all applicable laws, regulations, permits, and licenses on the date listed above.

A handwritten signature in black ink, appearing to read "Paul V. Conrad".

Paul V. Conrad

## COLUMBIA ANALYTICAL SERVICES, INC.

<b>Client:</b>	Premier Environmental Services	<b>Service Request No.:</b>	J0604485
<b>Project:</b>	Wiggins Soil Pile	<b>Date Received:</b>	9/19/06
<b>Sample Matrix:</b>	soil		

### CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier II data deliverables, including results of QC samples analyzed from this delivery group. When appropriate to the procedure, method blank results have been reported with each analytical test. Analytical procedures performed by the lab are validated in accordance with NELAC standards. Parameters that are included in the NELAC Fields of Testing but are not included in the lab's NELAC accreditation are identified in the discussion of each analytical procedure.

#### Sample Receipt

4 soil samples were received for analysis at Columbia Analytical Services on 9/19/06. The samples were received in good condition and consistent with the accompanying chain of custody form. Samples are refrigerated at  $4\pm 2^{\circ}\text{C}$  upon receipt at the lab.

#### PAHs and PCP by GC-MS SIM

##### Batch QC Notes and Discussion

Quality control samples for MS/DMS were performed using samples from another sample delivery group (SDG). The frequency requirement for quality control sample analysis was consistent with the project's requirements. Matrix specific quality control results have no bearing on sample data from a different matrix or location. Therefore, control of the batch has been evaluated using the method blank and the laboratory control sample.

No problems were observed with this delivery group.

Approved by

*Tom D. Hissong*

Date

*9/21/06*

## Data Qualifiers

### Inorganic Data

- \* The result is an outlier. See case narrative.
- # The control limit criteria are not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- E The result is an estimated amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- Z Too many colonies were present (TNTC). The numeric value represents the filtration volume.
- i The MRL/MDL has been elevated due to matrix interference.
- X See case narrative.

### Metals Data

- \* The result is an outlier. See case narrative.
- # The control limit criteria are not applicable. See case narrative.
- B The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- E The reported value is estimated because of the presence of matrix interference.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The result was determined by Method of Standard Additions (MSA).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL has been elevated due to matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.

### Organic Data

- \* The result is an outlier. See case narrative.
- # The control limit criteria are not applicable. See case narrative.
- A The tentatively identified compound is a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria were exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides)
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a chromatographic interference.
- X See case narrative.

### Petroleum Hydrocarbon Specific

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.
